jishnukolar4@gmail.com | 9847402566 | LinkedIn | Github | Portfolio

## Technical Skills

---

**Languages:** Python, C, HTML, CSS, Assembly, Ladder Logic

**Instrumentation & Control:** Temperature Process Control, Flow Process Control, Pressure Process Control

**Tools & Platforms:** MATLAB, LTspice, CODESYS, RSLogix 500, Proteus 8, Zelio Soft 2, InTouch, VS Code, Git & GitHub

## Education

---

**APJ Abdul Kalam Technological University**, B.Tech in Applied Electronics and Instrumentation Engineering (CGPA: 4.91/10) 2022-2026

**Industrial Automation Course**, IPCS Gobal. | Kozhikode, Kerala July 2026 -present

- Developed and tested PLC ladder logic using **RSLogix 500**, **Zelio soft** for industrial automation sequences.
- Developed and tested SCADA applications using **InTouch** for real-time process monitoring and control.

## Certification & Training

---

**Introduction to Internet of Things** | NPTEL 2025

**Industrial Automation Training** | SMEC Automation (PLC, SCADA, Process Control) May 2025 – June 2025

## Experience

---

**Industrial Automation Intern**, SMEC Automation Pvt. Ltd. | Ernakulam, Kerala May 2025 – June 2025

Worked on **PLC programming** and **SCADA** development for industrial automation applications, including process control and industrial communication.

- Developed and tested PLC ladder logic using **RSLogix 500** for industrial automation sequences.
- Configured **SCADA** dashboards for real-time monitoring and control of industrial processes.
- Tested and validated **PLC** and **SCADA** applications to ensure reliable industrial process operation.

## Projects

---

**ESP32-Based Smart Doorbell with Facial Recognition** GitHub | Smart Door Lock

Developed a **smart doorbell** that scans the visitor's face when pressed, grants access to recognized users, and alerts the owner for unknown visitors.

- When the button is pressed, triggers the doorbell and simultaneously scans the visitor's face.
- Grants access to recognized users and denies entry to unknown visitors a secure and convenient keyless access control.
- Remote monitoring and instant alerts sent to the owner through a messaging app for unknown or unauthorized visitors

**Tools & Language:** ESP32 cam, Sketches (C/C++)

**AI-Powered Smart Glasses for Visually Impaired Assistance** GitHub | Smart spectacle

Developed a **multi-modal assistive device to help visually impaired** users to navigate, shop, and interact socially, enabling greater independence in daily life.

- **Navigation:** Detects real-time obstacles using a camera and sensors, providing directional audio and haptic feedback to guide the user.
- **Vision AI:** Real-time object identification, scene description, and barcode scanning matched against a local product database using AI models.
- **Face Recognition:** Recognizes known faces in real-time and speaks the person's name to the user, with the ability to enroll new faces directly on-device.
- **Fall detection :** Automatically detects falls using sensors, performs a consciousness check within a set time limit, and if unresponsive, instantly sends an SOS with live GPS location to trusted contacts.

**Tools & Language:** Python, Raspberry Pi 4, OpenCV, YOLOv8, MobileFaceNet, ncnn, MediaPipe, TFLite, Google Gemini API, Google firebase, Livekit
